

[WinSPS S7 V5 \[Full Version\]](#)

User Manual WinPLC7 V4

Object list for OFF-LINE and ON-LINE views

The new object list replaces the existing "block management" dialog (note: this dialog is still available). The object list displays the project contents (sub-project). The following objects are displayed here:

- Blocks (OB, FB, FC, SFC, SFB, SDB)
- UDTs (user defined types)
- Lists of status variables
- Symbol tables
- Document files that describe the current sub-project (WORD, EXCEL, etc.)

An object list can also display PLC blocks directly (ONLINE object list). It is also possible to open several object lists and objects can be copied and edited by drag and drop operations.

Stations that are accessible via Ethernet with temporary assignment of IP parameters

Version 4 of WinPLC7 provides TCP/IP access to any PLC that has not been configured. This is made possible by allocating a temporary IP address that remains valid until the PLC is switched off. Until now it was necessary to first configure the PLC by means of an MPI interface, before it could be accessed via Ethernet.

A new and comprehensive online help system

The online help was revised completely. Not only does it offer help on WinPLC7, but it also contains tips and tricks on S7 PLCs.

You can now use the SIEMENS MPI adapters

Starting with version 4 of WinPLC7, the system supports the SIEMENS MPI adapters:

- CP5611
- CP5512
- SIEMENS MPI-USB adapter
- etc.

This option is subject to the condition that the hardware drivers are available on the PC. This is true, if one of the following software products was installed on the computer:

- STEP[®]7 V5.x
- Prodave V5.6 incl. service pack
- SIEMENS Teleservice option

Remote maintenance via analog/ISDN telephone lines is available when using SIEMENS Teleservice V6 (e.g. TS adapter II)

WinPLC7 version 4 was tested and released for use under Windows Vista.

Support for Windows Vista

WinPLC7 version 4 was tested and released for use under Windows Vista.
